

SkyVault Company Profile

Company Overview

SkyVault, Inc. is a leading developer of modular data center solutions and AI Factory master design IP tailored for large, committed-use AI customers. Our mission is to remove the friction from traditional data center development and enable the world to harness AI to advance engineering, science, and technology for a better global future.

SkyVault is redefining how critical markets and supply chains operate across infrastructure, power, cooling, and construction in North America, Europe, and Asia. Traditional data centers rely on static, fixed-shell builds with lead times measured in years. By innovating construction methodologies and leveraging advanced simulation platforms such as NVIDIA Omniverse, SkyVault compresses these timelines from years to just a few months.

Integrating testing into the development process itself ensures that facilities are more reliable and dramatically reduces the variables encountered during commissioning. This approach not only improves performance but also accelerates delivery. Ultimately, it paves the way for the **elastic data center**, a new substrate capable of delivering large volumes of pre-configured compute for AI training and inference.

SkyVault is committed to creating compounding, sustainable value for its stockholders and stakeholders by securing leadership positions in high-growth, profitable end markets that address some of the world's most pressing challenges.

Product Lines

AI Factory Architecture IP Design Services – SkyVault provides a fully tested designs for AI factories ranging from 2mW to 1.2GW in scale using our library of modular pre-fabricated data center components. Our Master IP design services are linked to NVIDIA's data center reference platforms including Grace Blackwell 200/300 NLV72, Rubin and

Rubin Ultra designs. Licensors of SkyVaults master designs are building large scale facilities in partnerships with local governments and generally operating as sovereign cloud platforms designed to align with government initiatives on AI. SkyVault receives a royalty for all data centers constructed equivalent to a percentage of the powered shell development fee.

Delivery of Physical Data Center Services - SkyVault provides a stabilized environment suitable for the operation of GPU-equipped servers requiring liquid cooling. The data center module infrastructure will include an appropriate physical environment, physical security, power, air and liquid cooling systems, and redundant systems to ensure operational reliability. To ensure reliable installation and operation the data center shall be modularized with pre-tested power, cooling and network equipment in the Infrastructure Provider's factory.

NVIDIA Cloud Provider services, SkyVault provides pre-installed and pre-configured server clusters equipped with NVIDIA GPUs designed for AI training and AI inference use cases. SkyVault handles all maintenance and break-fix operation of the GPU server infrastructure and replaces failed components in a timely fashion and ensures a high quality of system and network operations.

Management Team

SkyVault's leadership team brings deep industry expertise and proven execution capability. The Company's CTO and technology leader previously served at the largest NVIDIA Cloud Partner in Asia, while the CEO holds degrees from Penn State and MIT and has held senior roles at General Motors and UTStarcom. SkyVault's global operations are supported by teams based in the United States and Japan, with an advanced R&D group located in Silicon Valley. This combination of financial strength, operational scale, and seasoned leadership provides a strong foundation for continued growth and delivery.

Corporate Details

SkyVault is incorporated in Delaware and has branch offices in Taipei and Tokyo.
